To minimize the complexity of a project, Photoshop offers the ability to duplicate an image in a variety of ways to produce a number of different variations of a single image. These are called _layer modes_. ## Introducing Layers Unlike other image-editing programs, which work directly with pixels (dots), Photoshop works with objects called _layers_. These objects are organized on Photoshop layers in a single document. This arrangement presents a tremendous amount of flexibility, as layers enable you to combine, move, and transform objects without having to first select and then manipulate each individual object. This arrangement makes a good deal of sense when you consider that layers contain the source of an image's color. Because each layer contains only the color of one source, when you work in layers, you have the unique opportunity to see the results of changes as they happen. Photoshop layers come in two basic types: * **Normal,** the default type of layer, determines the default color of any object placed on a layer. * **Composite** layers add objects and patterns to another layer. ## Making a Layer You use Photoshop layers to accomplish two things: To combine two or more objects, and to create a text layer.

The present invention relates to a new and distinct cultivar of Regal Geranium plant, botanically known as Pelargoniumxhortorum, commercially referred to as a cut rose geranium, and hereinafter referred to by the name 'Regalsnap'. The new Regal Geranium is a product of a planned breeding program conducted by the Inventor in Alva, Fla. The objective of the breeding program is to create new cut flower Regal Geraniums that have uniform plant habit and numerous attractive flowers. The new Regal Geranium originated from a cross-pollination made by the Inventor in January, 2007 of a proprietary selection of Pelargoniumxhortorum identified as code number R67, not patented, as the female, or seed, parent with a proprietary selection of Pelargoniumxhortorum identified as code number R158, not patented, as the male, or pollen, parent. The cultivar Regalsnap was discovered and selected by the Inventor as a flowering plant within the progeny of the stated cross-pollination in a controlled environment in Alva, Fla. in April, 2008. Asexual reproduction of the new Regal Geranium by vegetative terminal cuttings in a controlled environment in Alva, Fla. since June, 2008 has shown that the unique features of this new Regal Geranium are stable and reproduced true to type in successive generations.Q: Flux Pattern in Monotouch I'm trying to understand the concept of Flux pattern in a test case for monotouch applications, but I'm stuck at the following point: I have two boxes, boxes A and B. Box A is supposed to call a method/function that has a return type of string. This method just returns the string "HALO". Box B receives a string and returns a bool. This returns either true or false. I'm trying to test the behaviour of the following: Box A calls Box B. It receives a string, and just returns HALO, it doesn't do anything with the box B action. Box B when receives a string, it returns HALO if the string is "HALO" and returns false otherwise. Why will Box A be getting an exception when it receives "ALO"? A: If Box A calls Box B with a string in it, then Box A will get two results:
