Fellow Engineer and Software Architect (TSE), Tony Gaskin is a 25 year veteran of the CAD industry, has authored/co-authored over a dozen books on AutoCAD, the SAS Macro Language, database design and programming. As a long time AutoCAD user, Tony is a regular contributor to CAD User magazine and AutoCAD Tips and Tricks. In addition to authoring his own books, Tony has co-authored six books with other Autodesk authors. Tony has a bachelor's degree in Electrical Engineering from the University of Toronto and a master's degree in Electrical Engineering from McMaster University. Introduction View My Garage In this tutorial, we will learn how to create a custom macro in AutoCAD that allows the user to create/edit the information stored in the drawing's Reference Data Manager (RDM). An RDM is a database used to store information about drawing objects. An RDM can store values, such as the length of an object, the displacement of a point, the elevation of a surface or the position of a marker. An RDM can also store information, such as the name of the drawing, the date the drawing was created, the author of the drawing or the drawing number, or any number of other data elements. Creating and manipulating an RDM is a feature that has been around since AutoCAD was released in 1987. RDM information is collected from the CAD system and stored for use by CAD operators in the future. For example, if you decide to start a new drawing, the values you defined for an object in an RDM will already be available for use. If you open a drawing that you completed a few weeks ago, some of the RDM information may be out of date, but the information you defined will still be available. The RDM is a powerful tool for storing information and is used in many applications besides AutoCAD, including Microsoft Word, Excel, PowerPoint, Sage® Accounting, Microsoft Project and more. When you need to add or change RDM information, you create a new document to record the new information, close the existing document and reopen the new document to make the changes. In this tutorial, we will define an RDM that lists all of the drawing's surfaces and properties. We will store information in the RDM about the dimensions of each surface and the type of the surface. For example, if a line is detected that connects the
