Thyrotropin-releasing hormone stimulates release of GnRH from perfused hypothalamic explants via PKC and phospholipase C. The present study was designed to elucidate the mechanisms of thyrotropin-releasing hormone (TRH)-induced GnRH release from rat hypothalamus. To determine the mechanism of action of TRH, we measured the calcium (Ca²⁺) level and phospholipase C (PLC) activity in the medium. TRH significantly increased the level of Ca²⁺ in a time- and concentration-dependent manner. TRH also significantly increased PLC activity; however, the levels of both phosphatidylinositol (PI) and phosphatidylinositol 4,5-bisphosphate [PtdIns (4,5)P₂] were slightly but significantly decreased. TRH also increased PKC activity, and a specific PKC inhibitor, calphostin C, dose-dependently inhibited GnRH release. PKC activity in whole hypothalamic tissue was detected by immunohistochemistry. TRH stimulated PKC in both the central and peripheral areas of the hypothalamus. Thus, we
